INSULATED CHIMNEYS

TYPE SLIM NEGATIVE PRESSURE

Example of marking elements manufactured according to the standard EN 1856-1

EN 1856-1 T450 N1 W V_m L30050 G100

Standard number
Maximum working temperature
Pressure class (N: negative pressure,
P: positive pressure)
Resistance to condensate (W: wet; D: dry)
Resistance to corrosion according to type and thickness of material
Material specification (50-1.4404, 20-1.4301, 30-1.4307)
Thickness of material (0.XX mm)
Resistance to soot fire (G: yes; O: no), distance from flammable materials (100 mm)

INSULATED CHIMNEYS

TYPE SLIM NEGATIVE PRESSURE

Insulated chimneys type SLIM are used to carry off exhaust flue gases from gas heating units and dry exhaust flue gases from boilers combusting fuel oil, wood and wood pellets. The system consists of thin-walled components from stainless steel. As a result, using the low thermal inertia of the chimney, the dew point is exported beyond its area - and thus the chimney operates in a dry mode. An entire range of boilers and units, except for condensation units, may be successfully supported by this type of chimney with a proper regulation of working parameters and operation under normal conditions. Keeping the dry operation mode is supported by the use of draught regulators. The insulated chimney type SLIM is also a perfect solution for ventilation purposes.

Properly assembled chimneys completely comply with domestic building regulations and fire safety regulations as well as European technical standards. Chimneys type SLIM may be used both inside and outside buildings. After the segments are assembled, the chimneys, depending on the variant of execution, are fixed with the use of special clasps to the walls of buildings, neighboring structures (e.g. boiler stations) or supported on independent support structures.

The elements of insulated chimneys type SLIM consist of:

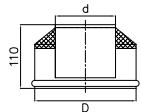

- an internal chimney liner made from acid-proof steel type 1.4301
- a thermal insulation from special mineral wool, thickness 30 mm and density at least 100 kg/m³
- an external jacket made from acid-proof steel type 1.4301, polished surface.

Their easy configuration from simple, modified components of the chimney run, the structure of washout hole, connection and support components provides a permanent and sound product after assembly with high rigidity achieved due to the use of socket joins, length 60 mm. The structure and applied insulation materials eliminate the presence of heat bridges and the necessity to use the compensators of linear expansion by ensuring free operation (expansion and shortening resulting from the thermal expansion of steel) for the internal liner with respect to the external jacket.

Insulated chimneys type SLIM comply with the following European standards: EN 1443 and EN 1856-1. The production of insulated chimneys is covered by a system of factory production control, certificate No 1020-CPD-070038635 (TZUS Praga). KOMIN-FLEX has implemented and maintains a quality management system compliant with the requirements of the standard EN ISO 9001:2015 certified by TZUS Praga.

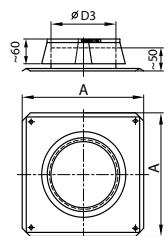

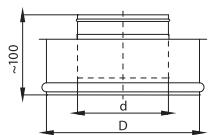

Chimneys by KOMIN-FLEX have received a positive opinion and are recommended by the professional association of Polish chimney sweeps.

ASSEMBLY MANUAL

VERSION I AND II

1. Forge openings in the wall according to the flue pipe run.
 2. Set two rings in the opening for the flue pipe (on both sides of the wall) in such a way so that their common axis is level.
 3. Mount a horizontal pipe into the embedded rings. Make sure that the flue operates in a slide manner.
 4. Fix an connecting component with the boiler's flue on the pipe from item 3, from the side of the boiler station. When an adjustable component is used, adjust the dimension, lock and seal the pipes facing one another.
 5. Mount a tee with a washout hole on the external side of the pipe from item 3 and fix them facing one another with a mounting clamp.
 6. Find a vertical axis for the chimney in a defined distance from the external wall.
 7. Mount the flue chimney's support console.
 8. Mount counterbalance consoles in intended places as the chimney's installation progresses (see figures 1, 2).
 9. Mount the chimney's vertical sections one by one. If an installation drawing is provided, the mounting sequence should follow the assigned numbering. Clamp particular elements with the use of mounting clamps. Mount the clamps according to the symbols placed on the inner side of the element. The method of mounting the chimney's particular elements is shown on the drawings: „Mounting stages of chimney elements”.
 10. Fasten the mounted flue chimney to the external wall with available clamping rings every approx. 2 m (see figures 1, 2).
 11. The last clamping ring needs to be located no more than 0.1 to 0.2 m from the wall top.
 12. The maximum height of the chimney between the supports is 15m. If the chimney is higher, use counterbalance console.
 13. Mount the last two pipe elements separately and put a mouthpiece over them. The connection may be additionally strengthened by jacket riveting.
 14. Mount the chimney termination prepared in this manner on the installed flue chimney and fix with the last clamping ring. Pay attention to the maximum projection of the chimney above the last clamping ring (see figures 1, 2).
